IMOBX

Pilot and building guide

Project proposal · v0.5 · 17 October 2026

1. Homes with a path to ownership

IMOBX is preparing a rent-to-own housing project in Rio de Janeiro. A family would rent a home under an agreement explaining how it can become the owner. The organization would arrange access to property, contract construction and manage repairs and accounts.

The proposed first project is for families who have been displaced or cannot access ordinary housing finance. Location and payments need to fit each household's circumstances, including work, school, transport and support networks.

Rafael brings construction experience and local knowledge. John works on communication and digital tools. The organization's legal form, property arrangements and their responsibilities remain to be agreed in writing.

How the operation would fit together

Part	Proposed arrangement
Homes	Documented property rights, a building budget and a clear family agreement.
Money	Separate records for funding, payments, costs and amounts set aside.
Decisions	Defined powers for residents, staff and any investors.
Services	A way to request repairs, follow progress and question decisions.

Shared designs, purchasing and administration could make further projects easier to deliver. Each family would have a route to owning its whole home. Residents would help shape shared spaces and local priorities.

The project is in preparation. This guide describes how work would move from a request to accepted delivery and payment. The project reference records evidence, responsibilities and sources in Portuguese and English. The whitepaper explains the model; the roadmap sets out stages and conditions for proceeding.

2. Housing designs and building costs

Rafael’s village proposal

Rafael’s plan brings together 45 m² two-level homes around a shared courtyard, with solar panels, fruit trees, play space and two study rooms. The illustration shows the intended community, rather than a completed development.

On 30 November 2025, Rafael supplied building calculations using CUB and SINAPI, Brazilian cost references. His revised per-home budget is:

Item	USD per home
Land	5,550
House construction, 45 square metres	18,600
Solar	1,500
Shared infrastructure and facilities	1,500
Legal and design	627
Total	**27,777**

The plan covers at least 36 homes built together over 12 months: **36 × US$27,777 = US$999,972**. These are Rafael’s dated project figures, not a finished-home price published by the indexes. A chosen site needs a budget in reais covering its actual work, permissions, services and unexpected costs. SINAPI; CUB scope.

The separate two-loft case

On 20 January 2026, Rafael reported a contract for two lofts on a steep site, awaiting its first deposit. **US$27,777 covers both lofts together**, equivalent to US$13,888.50 each by division. Included work, current progress and final costs still need documentation. This is a separate case from the village budget. Drawings and supplied photos.

3. Payments and home ownership

The family’s agreement

In the proposed arrangement, a household lives in the home and pays an agreed monthly amount in reais. Its agreement identifies the purchase price and how much of each payment counts towards buying the home. Its purchase record then shows the credit accumulated and the remaining agreed price.

The first household’s purchase price, monthly payment, purchase credit and payment period have not been set. Rafael’s construction budgets are evidence for assessing building costs, not household sale offers. The household would not need to buy an investment token or use a crypto wallet. Household explanation in Portuguese and English.

Repair charges, missed payments, temporary hardship and leaving need separate terms. In particular, the treatment of accumulated purchase credit on exit remains unresolved. No refund formula or grace period is established here. These terms belong in the offer the household assesses before agreeing to move in.

What the money would pay for

The proposed budget covers taxes, property costs, maintenance, administration, commitments to families and money set aside for unexpected expenses. New construction and any investor payments need their own agreed funding and terms. Donations and grants retain their specified uses.

Each receipt is counted once. An amount credited toward buying the home records the family’s progress; it is not another receipt of cash. The spending plan needs to preserve the organization’s ability to complete the promised home transfer.

When the home becomes the family’s

Once the purchase conditions are met, the required documents and registration would transfer the whole home to the household. A token transfer does not perform that property transfer. IMOBX would stop receiving rent from the home. Continued services and further construction would need their own funding; any ongoing service charge would need an actual service and terms the household agreed to.

The financial plan needs to show costs and cash through construction, occupancy and transfer. It also needs to account for delays, major repairs and periods when a household cannot pay. Money and transparency.

4. Funding construction and growth

The first project needs funding for its contracted work. Possible sources include donations, grants, service income and a permitted investment. The token proposal also aims to fund branding and a community outreach programme. Housing, outreach and any investor payments need their own approved budgets. Token rights remain under study; the four paths range from proceeding without an IMOBX token to an investment in the operation.

New investment and later trading

Investors could buy tokens directly from IMOBX to help fund its work. We still need to agree what buyers would receive in return. A later sale between investors normally pays the seller. A separately collected trading fee could provide additional money to the project where the agreement allows it.

The housing budget needs to work through periods of little or no trading income. Accounts would show the fees actually received and their agreed use.

Money available for building

Funds committed to a trading market are unavailable for construction while that commitment lasts. The accounts would distinguish money available for bills, amounts reserved for families and repairs, and other commitments.

New investment could finance agreed work before rent begins once the organization, property authority, budget and permitted fundraising route are ready. Forecast rent is not money already received. Payments to investors depend on the chosen agreement and actual available funds. Funding questions.

How outreach work would be paid

An approved campaign budget would fund specific work briefs. A participant would submit their work; a reviewer would compare it with the brief before approving payment. The community tool could show submission, review and payment status. Paid participants need to disclose compensation and follow each channel’s rules.

Work payments and passive investment income require separate terms. The token model and its rights remain under research. Residents would not need to promote the project to retain housing or decision rights.

5. Participation and decision rights

A family’s housing agreement, its membership voice and an investment are separate relationships. One person could have more than one role.

Participant	What needs to be clear
Families	Affordable payments, repairs, purchase progress, hardship, leaving and whole-home transfer.
Property contributors	Donation, lease or sale terms; title, debts and transfer costs.
Staff and resident representatives	Powers, pay, appointment, spending limits, reporting and replacement.
Builders and suppliers	Work, price, payment stages and independent completion checks.
Donors and social funders	Permitted use, reports, delays and cancellation.
Possible investors	Issuer, claim, income source, costs, losses, voting, transfers and exit.
Neighbours	Local impacts, services, access and a way to raise concerns.
Independent checkers	Authority and access to review property, safety, accounts and agreements.

Study-room hours, courtyard use, shared-space repair priorities and representative selection are examples of resident decisions. One option under discussion is one vote per member for those matters. Staff would have agreed duties and spending limits, with someone else checking completed work. Investor rights would follow the selected investment agreement.

A household’s purchase terms would follow its agreement. Buying tokens would not give control over another family’s contract. The voting procedure, spending limits and dispute review process remain to be developed with participants. Decisions and repair examples.

Ostrom’s work informs questions about membership, shared rules, checking work and resolving disputes. These questions apply to facilities such as solar equipment, the orchard and study rooms. Decision examples; participant map; CVM guidance.

6. Records, payments and support

The proposed digital services would help people read agreements, request repairs, follow work and check approved information. Private family documents would stay outside the public website and blockchain.

Record or service	Purpose
Project website	Explain the proposal, current progress, costs and documents.
Support channel	Receive questions and requests, with a visible response and status.
Legal records	Document property authority, family agreements and any investment.
Accounts	Connect each receipt and payment to its purpose and evidence.
Shared work record	Show responsibilities, decisions, deadlines and checked delivery.

Following a payment

Families would pay in reais. IMOBX would keep money for Brazilian bills. Any approved digital payment needs a provider that accepts the organization and its activities, a record of conversion costs and a tested return to the bank. No provider is confirmed for IMOBX. Proposed money path.

If an investment permits income payments, software could maintain a record of what each eligible person may claim. Running costs would include setup, individual claims, corrections and support. No operating-cost saving is established yet.

How a repair would move forward

A resident reports a leak. The maintenance role assesses it and obtains a quote. Spending follows the agreed budget and approval rule. Another person checks the completed repair; the accounts link its payment and receipt. The resident can question the result. Records of unfinished work support a replacement when someone leaves a role.

The complete process, including payment failures and lost access, still needs to be demonstrated. A public report would link an approved budget to accepted delivery and the amount paid. It would identify who prepared and reviewed the accounts. Private identity and household documents would remain outside the public site. Everyday decisions and tasks.

7. Development stages

IMOBX's development plan connects the first homes in Rio with resident participation, transparent accounts and additional funding. Legal preparation, community discussions and digital trials can progress in parallel. Construction dates depend on each project, funding and permissions.

Stage	Intended result
Legal structure and property	A responsible organization, documented property authority and reviewed housing agreements.
Resident participation	A say in shared matters without buying investment tokens, with defined budgets and review procedures.
First homes	Funded construction, safe occupancy and records of household payments and purchase progress.
Transparent treasury	A demonstration of USDC receipts and authorized payments on Arc, linked to accounts and evidence.
Funding and account review	Identified funds, authorised spending and funded commitments to households.
More homes and owner partnerships	Further projects with local teams and possible rent-to-own services for participating owners.

Following an operating project

The proposed monthly report would show receipts and payments, amounts set aside, building costs and delays, repairs, unresolved issues and families' purchase progress. Every receipt and payment would be checked against its records. Affordability and service-response targets need to be agreed locally.

A first expansion review is proposed after at least three operating months. This is a review point, not proof of long-term viability. A second local team should be able to repeat the process, with funding for new work that respects existing commitments. The detailed roadmap identifies proposed responsible roles, conditions for proceeding and reasons to pause. Named appointments and delivery dates remain open.

What the public can follow

The website explains the proposal now. As the project develops, reports would show signed agreements, approved work, funding received, construction and home transfers. Any investment access would follow defined rights, legal review and checked payment arrangements. Detailed roadmap.

8. Project status and next steps

The housing operation and financial token remain in preparation. Published drawings and budgets help explain the intended work; they do not establish completed homes or an available investment.

Area	Current position
Design and costs	Rafael’s dated village budget and the separate two-loft account are available.
Property	The first project needs documented ownership or authority to use the site.
Organization	Legal form, accountable roles and agreements remain to be finalized.
Families	Eligibility, affordability, individual terms and shared decision rights need local discussion.
Funding	No received grant, investment amount or donated-property count is confirmed here.
Token	Branding and outreach are intended uses. The issuer, financial rights, supply, access, income and transfer terms remain under study.
Payments	Provider acceptance and the complete payment route remain to be demonstrated.

Evidence for the next project decision

The proposed readiness review brings together the property documents, site-specific budget, construction permissions, family terms, responsibilities and funding plan. Relevant building, accounting and legal professionals would review their parts. Participants would be able to see which commitments are agreed and which questions remain open.

Following progress

Planned reports would distinguish proposed, signed, paid and completed work. Residents would have access to their own agreements and purchase records. Public accounts would explain project spending without exposing household documents.

The project reference maps Rafael’s manuscript chapters to the current proposal and sources. It identifies open work, including the complete financial model and professional review. Photos and drawings show the supplied design and site material with captions. No investment is offered through this guide.
