IMOBX

Pilot and building guide

Revision 0.3 · 15 October 2026 · draft for founder review

1. What we are preparing

IMOBX is preparing a first rent-to-own housing project in Rio. A family would rent a home under a written agreement that explains how it can become the owner. IMOBX would arrange property access, building work, repairs and accounts.

Rafael brings construction and local experience. John handles community communication and digital work. The legal organization, their responsibilities and the right to use each property need written agreements. This sheet confirms no property donation, token sale or working payment service.

The four parts to connect

Part	What needs to be ready
Homes	A chosen home, the right to use it, a building plan and a clear family agreement.
Money	Record each payment once; cover bills, repairs and promises to residents.
Decisions	Agree what residents, workers and any investors may decide.
Digital tools	Show approved information, answer questions and let people check payments.

The proposed advantage

Reuse good building plans, agreements, purchasing and accounts so another local team can deliver more homes. Each family should be able to own its whole home; a separate group of investors would not run each house.

SIAH Protocol is the brand. Hive DAO names the rules and tools for shared responsibility. People should see what needs doing, choose work and leave information for whoever continues. The plan combines Ostrom’s ideas about shared resources, software agents, Arc payments, possible Arctide fees and The Flock’s Telegram bot. IMOBX still needs to demonstrate the complete process. Explanation.

Design basis for this revision

Cover homes and ongoing commitments before considering money for investors. Keep rent, donations, grants and fees separately identified. Old token supply and payout percentages are options from earlier discussions, not chosen rules.

This is a working plan, not an investment offer. The whitepaper explains the project for a wider audience.

2. The home, budget and resident pathway

Rafael’s reference-based cost budget

Item	Rafael’s budget, USD per home
Land	5,550
House construction, 45 square metres	18,600
Solar	1,500
Shared infrastructure and facilities	1,500
Legal and design	627
Total	**27,777**

Rafael used CUB and SINAPI, Brazilian building-cost references. On 30 November 2025, he supplied the calculation, land allowance and revised budget above. He specified at least 36 homes built together over 12 months: **36 × US$27,777 = US$999,972**.

For the chosen site, record the price date, quantities, included work, prices in reais and actual bills. Check land, permissions, utility connections, unexpected costs and later maintenance. CUB leaves out some items, including builder payments; deducting a presumed profit percentage does not itself show a saving. CUB scope; SINAPI.

Separate two-loft development account

On 20 January 2026, Rafael reported a two-loft contract on a steep site, waiting for the first deposit. **US$27,777 covers both lofts**, or US$13,888.50 each by division. This is separate from the village plan. Record the included work, funding, current progress and final cost before calling it delivered housing. Drawings and photos.

Before including a property

Check its owner, debts or restrictions, condition, building responsibilities and permissions. Record whether it is being donated, leased, sold or made available another way. A promise is not a received property. Check the builder’s catalogue against completed work and permission to publish it.

Resident agreement to design locally

1. Say who may join, what they can afford and which home is included.

2. Explain payments in reais, price changes, repairs and amounts credited toward purchase.

3. Explain late payments, hardship, leaving, disputes and what happens if IMOBX fails.

4. State the final price, transfer conditions, registration and who pays those costs.

The earlier US$250 payment over 180 months is an example, not a current offer. Paying for 15 years does not by itself transfer title. Families need a clear purchase agreement and help that does not require buying a token or using a crypto wallet.

3. Cash allocation and the 15-year transfer

Proposed housing-first cash order

Money received → taxes and money with a required use → property and running costs → resident commitments and savings for future needs → approved new homes → any legally permitted investor payments.

Agree the actual budget before using this order. Keep enough money in reais for Brazilian bills. Record the exchange rate and all costs when converting to USDC.

Correct the original rental arithmetic

The old example used US$250 rent, an assumed 15% tax and payment of 98% of the after-tax amount to participants. It works out as follows:

Destination	Per month	180 months
Tenant payment	$250.00	$45,000
Assumed tax	$37.50	$6,750
Distributed under the old 98% rule	$208.25	$37,485
Retained under the old 2% rule	$4.25	$765

The US$45,000 arrives over time and is already divided above. There is no extra US$17,223 cash payment when the family becomes the owner. Another home needs money saved or another funding source. Any profit from selling to an outside customer is a separate transaction, after its own costs.

A retained-rent illustration, not a forecast

In another example, US$250 received minus US$37.50 assumed tax, US$20 property costs and US$1.70 conversion costs leaves **US$190.80 a month before central administration, major repairs and other bills**. These are unverified assumptions, not actual tax or price quotes. The accountant needs to replace them with the chosen project's figures. This calculation does not prove a three- or six-year payback.

Keep claims and cash distinct

Money counted toward a family's purchase is a promise to honor, not a second receipt. Spending it elsewhere must not prevent the home transfer. Once the family owns the home, IMOBX loses that rent. Follow the accounts through that point: how are existing bills paid, and what funds the next homes?

4. Trade fees, liquidity and pilot capital

What the documented Arctide market provides

Arctide lets people create and trade tokens. Its markets divide USDC fees between those supplying trading funds, the project and the platform. The fixed platform part is 0.25%; the total fee cap is 15%. These are not the old assumed flat US$10 buy and US$15 sell fees. Check the actual market settings and recipients. Its early bonding-curve sale has no trading fee. Documentation.

Measure what IMOBX actually receives

Count **project fees received plus any trading-provider fees that IMOBX has the right to claim and has received**. Check the records without counting a payment twice. Fees paid to others, trading volume and estimated unpaid fees are not IMOBX cash. Another exchange needs its own setup and may not pay the same fees.

Example of monthly trading	If IMOBX actually receives 1%
$0	$0
$100,000	$1,000
$1,000,000	$10,000

The 1% is an example, not a quote or chosen fee. At that rate, US$10 million of trading produces US$100,000 before spending. Higher fees may discourage trading. Trade sizes, demand, fees reaching IMOBX and quiet periods all matter; counting transactions alone is not enough.

Capital and fees have different destinations

A contract review on 12 October found that the standard Arctide sale sends roughly 98% of raised USDC into the first trading market. That money helps people buy and sell tokens; it is not also a building budget. The destination of fees from that locked position needs checking. Recheck this dated finding for the chosen setup; it is not an IMOBX funding agreement.

USDC fees can pay for agreed work without creating more IMOBX tokens for that payment. They still depend on trading. Test the budget with little or no trading, and check whether fees go elsewhere. Money raised for construction and money placed in a trading market need separate, agreed destinations.

5. Participation, token rights and governance

Rights map before token settings

Participant	What the agreement must explain
Resident	Housing, payments, purchase progress, repairs, hardship, leaving and ownership transfer.
Organization or board	Property authority, contracts, money set aside, personal interests, reporting and continuity.
Builder	Work, price and profit, progress checks, changes and completion.
Donor or grant funder	What the money may pay for, reports and any repayment conditions.
Investor, if offered	Who owes what, voting, who may join, costs, selling and possible payments.
Community contributor	Work, who checks it, agreed payment if funded and choices about personal data.

Ostrom’s work asks how people manage shared resources. We want to define who participates, involve residents in appropriate decisions, check commitments and make disputes easy to raise. For the village, this means agreeing who uses, maintains and replaces the solar equipment, orchard, play area and study rooms.

Rafael’s interest in governance tokens does not mean a resident token plan is chosen. We can discuss equal voice in resident matters and time-limited work roles. A token vote should not rewrite a family’s housing agreement. Longer experience may help someone stand for a role, while newer residents keep their basic voice.

Token decision table

Question	Current answer
What does it give, and how is ownership recorded?	To agree with Brazilian advisers and the chosen provider.
How many tokens and who receives them?	The old 1,000,000-token plan is an option, not a final choice.
Do residents get tokens?	No plan yet; housing and support do not require buying an investment token.
Who could receive income?	To define; owning a token, locking it in a staking service and funding a trading market are different roles.
How could people buy or sell?	To establish for the chosen rights and applicable rules.

The actual rights matter more than labels such as “utility,” “governance” or “nonprofit.” Have advisers review the proposed arrangement before an offer. CVM Guidance Opinion 40.

6. Development scope and acceptance evidence

What people send and see

Component	What people need from it
Website	Current progress, checked building costs, documents, responsible people and help.
Telegram / The Flock	Portuguese explanations, questions, updates and approved account summaries.
Legal records	Signed agreements, property authority and any investor records held by the responsible party.
Accounting and payments	Match the payer, purpose, bank receipt, conversion, USDC payment and final use.
Community software	Show approved contribution or reward results; the responsible backend team defines those systems separately.

Families would pay in reais. IMOBX would keep local money and convert only approved amounts into USDC on Arc. CCTP may help move USDC between networks; it does not convert it to reais. No provider is confirmed for IMOBX. A CNPJ does not guarantee an account. Private family agreements stay off the public blockchain. Show payments as waiting, confirmed, failed or needing investigation. Money path; providers.

Distribution accounting and the legacy Euler approach

The earlier contract review found a running calculation: when money arrives, update what people can receive instead of sending a payment to every person at once. People claim later. This may save work per deposit, but claims, storage and setup still cost. Argus also documents this pattern; it is not an exclusive Arctide feature. The old US$109 yearly cost and 99.9% saving are not supported by a comparable measurement.

Technical demonstration required before a live financial integration

The responsible technical team needs to:

1. Identify the network, token, market, fees, recipients, control powers and any money locked for trading.

2. Follow an approved payment from the bank record, through conversion, to the correct wallet and use.

3. Check fee receipts, who may claim, rounding, failed payments and what happens when someone’s position changes or nobody qualifies.

4. Test permissions, limits, repeated requests, retries and failures. Confirm who controls funds and who can recover access.

These are requirements, not a completed system or audit. Begin with a simulation. Any real deployment or money transfer needs specific approval. The usual token and staking setup is not assumed to provide every needed rule.

7. Pilot roadmap and success measures

The roadmap, decision examples and FAQ explain the plan. These are proposals for people to agree, not instructions to a working payment system.

Targets start from an agreed date. Building also needs property, money and permissions.

Target	What should be ready, and who would lead
Day 14	Written founder roles and a list of offered properties. Rafael and John.
Day 30	Chosen work, current budget in reais, draft family terms and property documents for review. Rafael and local advisers.
Day 45	Money rules covering repairs, quiet trading, home transfers and new building. Founders and accountant.
Day 60	Reviewed documents, resident discussion, decision rules, four worked examples and provider quotes. Founders and advisers.
Day 90	Decision to proceed or revise, with rights, money, responsibilities, reports and support ready. Responsible organization.

Once the pilot operates

• **Homes:** confirm property authority and sign the family agreement before moving in.

• **Money:** check 100% of receipts and payments every month. Explain differences and amounts with a required use.

• **Building:** record what was completed, actual costs and any delays.

• **Families:** record questions, repairs, participation and purchase progress. Agree affordability and response targets locally.

• **Next homes:** observe at least three operating months before the first review, and fund the next work without breaking existing commitments.

Website v1 explains the plan. Website v2 shows real progress and accounts without needing a token. Any v3 token access follows agreed rights, legal review and checked payment arrangements. No token launch date is set.

Pilot-funded growth, not assumed grant awards

Grants, donations and agreed service or building income may help. Record applications, awards and money received as different things. A UN development goal is not a grant. A thousand homes is a growth idea, not proof that income covers costs.

8. What changes from the original devsheet

Earlier idea	What this plan requires
Guaranteed token price floor	No price guarantee. Check property values, debts and actual investor rights separately.
Income rises when holders sell	A sale normally changes the owner. It does not create new income.
Pay out 98% of rent, then fund replacement homes	Show what has already been paid out and what money is still available.
Flat fees and profit in quiet markets	Use actual fees received and test quiet periods and full costs.
US$109 a year at any member count	Measure the full cost of running calculations and individual claims.
Locked trading funds prevent all losses	Check what is locked and its limits; price and building risks remain.
Offered founder properties and possible grants	Count only documented property rights and money actually received.
Comparisons with large financial products	Explain IMOBX's own homes, agreements, accounts and results.

Source and decision status

This revision uses the original eight-page IMOBX development sheet, founder discussions already recorded in the research, and the linked cost and platform sources. Earlier work checked the original PDF's text and layout; this wording update does not establish a fresh property or company audit.

Rafael supplied the historical budget and two-loft account. Arctide's documentation describes its service, not a completed IMOBX connection. Exact tax, title, permits, legal registration, grants and current building progress still need the appropriate documents and responsible review.

Use this sheet with founders, families, builders, accountants, housing advisers, lawyers and developers. When decisions are accepted, update the paper, deck and website together. State what is planned, signed, paid, completed and checked. This is still a development proposal, not a token offer or approval to run financial services.
