IMOBX

Developer & pilot specification

Revision 0.2 · 15 October 2026 · founder review draft

1. What we are preparing

IMOBX is a proposed Rio rent-to-own housing enterprise. It would coordinate property access, construction or refurbishment, resident agreements, maintenance and financial reporting. The first pilot should test whether a documented route toward ownership can operate within an affordable payment plan and a funded maintenance and administration budget.

Rafael supplies construction and local delivery knowledge. John supplies community and digital coordination. The chosen Brazilian entity, founder agreement, property control and resident contract must specify their accountable roles. No property contribution, token offer or IMOBX settlement integration is confirmed by this sheet.

The four parts to connect

Part	Required outcome
Housing	A specific home, documented control, delivery scope and a comprehensible resident agreement.
Business	Each receipt allocated once; operating costs, resident commitments and reserves covered.
Participation	Defined resident voice and, if selected, separate legally recognized token rights.
Digital service	Approved information, support, financial summaries and verified payment references.

The proposed advantage

Combine Rafael's delivery experience and supplied cost model with repeatable resident terms, a reinvestment policy, resident participation and accounts partners can check. Arctide is a candidate USDC market/settlement component. The Flock is the proposed Telegram project desk. These components support the housing organization; their use does not establish delivered homes or investor rights.

Design basis for this revision

The working direction is to fund housing costs and continuity before considering any surplus distribution. Trading fees may supplement pilot capital and operating reserves. Rent, trading receipts, grants and contributions remain distinct. Earlier fixed token supply and allocation percentages are retained as historical options, not configuration instructions. A future token follows the chosen rights and permitted transfer process.

This sheet replaces the original devsheet as a **review draft**. The whitepaper explains the full model; the partner deck and website use its verified public claims. None of these drafts is an investment offer. Companion paper.

2. The home, budget and resident pathway

Existing cost proposal: preserve and update it

Item	Historical USD estimate per home
Land	5,550
House construction, 45 square metres	18,600
Solar	1,500
Shared infrastructure and facilities	1,500
Legal and design	627
Total	**27,777**

The background proposal assumed at least 36 homes and a 12-month program: 36 × $27,777 = $999,972. These are founder-supplied estimates with shared costs, not a current one-home quote. For the selected pilot, document current BRL prices, land/control terms, permissions, utility connections, builder margin, contingency and lifecycle expenses. SINAPI and CUB are reference inputs to reconcile against scope and invoices; an index alone does not verify a particular complete-home price.

State the date, location, quantities and treatment of overhead/profit in the chosen price basis before applying the old 15% deduction. CAIXA: SINAPI reference documentation.

Separate two-loft development account

On 20 January 2026 Rafael reported a two-loft contract awaiting its first deposit and described a steeply sloping site. His $27,777 reference needs confirmation of cost unit and scope; it is a separate case from the 36-home proposal. The supplied drawings and site photograph give the pilot a concrete reporting example. Update the contract scope, funding, work stages and actual costs before treating it as delivered housing or a rent-to-own asset.

Before including a property

Record its owner or legal controller, encumbrances, condition, delivery responsibilities, contribution instrument, costs and required registration steps. A promised donation, sale, lease or operating mandate must be identified separately. Do not count offered homes as assets received. Check the builder catalogue against completed-work evidence and permission to publish it.

Resident agreement to design locally

1. Define eligibility, affordability, the home and responsible organization.

2. Specify the BRL payment, indexation, maintenance and any purchase-credit rules.

3. State hardship, default, exit, dispute and operator-failure provisions.

4. Define the final price, transfer conditions, registration and who pays transfer costs.

The original $250 monthly payment over 180 months remains an illustration. Fifteen years of payments does not itself establish the contractual purchase right or an unconditional deed-transfer promise.
No-down-payment and eligibility terms must be affordable and operationally funded before they are offered. Residents should be able to participate and obtain support without buying a token or managing a crypto wallet.

3. Cash allocation and the 15-year transfer

Proposed housing-first cash order

Receipts → taxes/restrictions → property and operating costs → resident obligations/reserves → approved housing growth → any lawful distributable surplus. Exact budgets and policies remain to be agreed. Keep enough BRL for Brazilian obligations; record rates and costs for any permitted USDC conversion.

Correct the original rental arithmetic

The original illustration used $250 rent, an assumed 15% tax and distribution of 98% of the after-tax amount. Its cash allocation is:

Destination	Per month	180 months
Tenant payment	$250.00	$45,000
Assumed tax	$37.50	$6,750
Distributed under the old 98% rule	$208.25	$37,485
Retained under the old 2% rule	$4.25	$765

The $45,000 is received over time and already allocated. There is no additional $17,223 cash receipt at handover. Replacement homes require retained cash or another actual funding source. A sale margin from an external customer is a separate transaction and can contribute only the agreed net amount after its obligations.

A retained-rent illustration, not a forecast

Using $250 received, $37.50 assumed tax, $20 property costs and $1.70 conversion costs leaves **$190.80 per month before central operations, larger repairs and other commitments**. These costs and tax are unverified modelling inputs. Actual tax depends on the selected arrangement; update with the accountant. This amount alone does not prove three- or six-year payback.

Keep claims and cash distinct

A resident's purchase credit is a contractual entitlement or obligation, not new cash income. Reusing receipts must not leave the home-transfer commitment unfunded. A transferred home leaves the operator's assets and its rent ends. Model cohorts through that event. Identify the retained portfolio, services or other recurring income that will support continuing operations. Report operating self-sufficiency and capital for additional homes as separate tests.

4. Trade fees, liquidity and pilot capital

What the documented Arctide market provides

Arctide documents USDC pool fees with separate liquidity-provider, project and platform components, including a fixed 0.25% platform component and a 15% total cap. Pre-graduation curve trades have no swap fee. The original flat $10 buy/$15 sell assumptions are not its documented default. Check actual pair settings and recipients for the chosen deployment. Provider documentation.

Measure what IMOBX actually receives

Treasury fee income = confirmed project-recipient receipts + assigned, realized liquidity-fee claims, reconciled without duplicates. Fees paid elsewhere, total market turnover and unclaimed estimates are not IMOBX cash. A token's trade on another venue may not pay the same project charge. Any supported additional market needs its own capital and recipient arrangement.

Illustrative monthly paid turnover	At an effective 1% treasury receipt rate
$0	$0
$100,000	$1,000
$1,000,000	$10,000

The 1% is an assumed effective receipt rate, not a quote or selected fee. At that rate, collecting a $100,000 gross treasury target requires $10 million of paid turnover, before operating uses. A higher rate can discourage trading. Include trade sizes, payer demand, venue capture and retained cash across busy and quiet periods; trade count alone does not establish sustainability.

Capital and fees have different destinations

Prior verified-source inspection on 12 October found that the standard Arctide curve directs roughly 98% of raised USDC into initial liquidity. Its default locked position's harvested fee destination also needs checking. Treat this as a dated finding to recheck with the provider; it is not a current IMOBX funding agreement. A construction raise and a pool-liquidity budget need explicit, separately accepted destinations.

Fees received in USDC can fund agreed work without issuing more IMOBX tokens for that payment. They still depend on market activity. The continuity model must include low/zero trading, changing liquidity-fee ownership and fees that bypass the treasury. No profitable-bear-market or launch-day-income claim is made.

5. Participation, token rights and governance

Rights map before token settings

Participant	Terms that must be explicit
Resident	Occupancy, payments, purchase credits, maintenance, hardship/exit and transfer.
Organization/board	Property control, contracting, reserves, conflicts, reporting and continuity.
Builder	Scope, price/margin, progress evidence, changes and completion obligations.
Donor or grant funder	Permitted use, restrictions, reporting and any recovery conditions.
Financial participant, if offered	Issuer, legal claim, votes, eligibility, costs, transfer and distribution rules.
Community contributor	Defined work, review responsibility, funded service/payment terms and data choices.

The Ostrom-inspired direction is to define membership and boundaries, involve affected residents in suitable decisions, monitor commitments and provide accessible conflict resolution. Local maintenance and shared-facility decisions can have resident representation within budget and safety duties. These are proposals to consult on. Rafael's interest in governance tokens has not established a tenant allocation or voting-weight plan.

Token votes should not rewrite a resident's signed housing bargain. Longer residence may inform eligibility for an elected role; any rule must be explicit and preserve newer residents' basic rights. Investor and resident authority require clear boundaries in the legal documents and operating rules.

Token decision table

Parameter	Current status
Instrument and legal register	To choose with Brazilian advisers and responsible provider.
Supply and reserves	Old 1,000,000-token plan is an option; no final allocation adopted.
Tenant token access	Not designed; housing/support does not require purchase of an investment token.
Staking and distribution eligibility	Must fit the actual rights; holder, staker and liquidity owner are distinct.
Offer, transfer and resale venue	To establish for the selected instrument; no unrestricted-market assumption.

Review the instrument's substance and actual offer under Brazilian guidance. A nonprofit form or a utility/governance label is not a classification by itself. This is a requirements exercise for the chosen lawful route. CVM Guidance Opinion 40.

6. Development scope and acceptance evidence

What people send and see

Component	Required visible behavior
Website	State current pilot status; show approved cost/milestone evidence, documents, accountable roles and support path.
Telegram / The Flock	Explain the project in Portuguese; route housing and project questions; show approved progress/cash summaries.
Legal/property process	Hold authoritative agreements, property control and any investor register with the responsible party.
Accounting/settlement	Reconcile payer, purpose, BRL receipt, conversion, USDC transaction and final use; preserve restrictions.
Community-service backend	Supply any authorized contribution/reward results for display; no member scoring design in this front-end repository.

Use a provider handoff for any permitted purchase or resale. QR/email convenience does not replace eligibility, consent, custody, ownership records or transaction confirmation. Keep identity documents and private resident agreements off a public ledger. The interface must state pending, confirmed, failed and unresolved outcomes accurately.

Distribution accounting and the legacy Euler approach

The earlier contract review found accumulator accounting: contributions update a running entitlement record rather than paying every participant in a single loop. Participants claim individually. This can reduce per-contribution work; total costs still include claim transactions, storage and integration. The old $109/year and 99.9% savings claims are removed pending an equivalent measured workload. No universal gas-cost claim is retained.

Technical demonstration required before a live financial integration

1. Identify the selected chain, token/pool contracts, fee settings, actual recipients, controller powers and liquidity ownership/lock terms.

2. Reconcile an authorized sample receipt from BRL bookkeeping through any conversion and USDC allocation to the intended destination. Keep construction capital and liquidity cash distinct.

3. Demonstrate fee capture and, if applicable, entitlement, zero-eligible-participant handling, claim/position-change behavior, rounding and failed-recipient handling.

4. Verify approvals, custody, transfer restrictions, authorization limits, duplicate/retry handling and failure reconciliation against the selected provider's terms.

These are acceptance requirements, not a designed API or an audit result. Use an isolated test or simulation first; live deployment or transfers require separate authorization. The standard token and staking path are not assumed to supply every needed investor control or payout rule.

7. Pilot roadmap and success measures

The following are **proposed planning targets relative to an agreed start date**, not confirmed commitments or launch forecasts. The founders should accept owners and dates after checking professional availability. Construction follows the selected funded scope and permissions, not these document-preparation targets.

Target	Deliverable and measurable completion	Proposed lead
By day 14	One founder responsibility/control agreement; one inventory covering every offered pilot property, with evidence status.	Rafael + John
By day 30	One selected pilot scope and current BRL budget; resident terms and property/control route submitted for local review.	Rafael + local advisers
By day 45	One cash model and allocation policy showing low/zero-trading needs, reserves, transfer obligations and separately funded expansion.	Founders + accountant
By day 60	Reviewed whitepaper and website v1 wording; resident consultation findings; priced legal/provider and digital implementation options.	John + Rafael + advisers
By day 90	Documented proceed/revise decision: accepted rights, cash available for the selected commitments, delivery responsibilities, reporting and support.	Accountable organization

Once the pilot operates

• **Rights:** every included home has documented control and an executed resident agreement before occupancy under the program.

• **Money:** reconcile every receipt and payment monthly; report restricted funds, reserve balance and unexplained differences as unresolved.

• **Delivery:** record actual cost, completion evidence and schedule variance for each included home.

• **Resident outcomes:** record support resolution, participation and ownership progress under the agreement; set service-time and affordability targets with residents.

• **Expansion:** fund the next cohort and its added operating responsibilities before committing to it. Do not use token price or holder count as evidence of housing delivery.

Pilot-funded growth, not assumed grant awards

Grants, donations and assigned external construction/service receipts are candidate funding routes. For each, establish eligibility, current terms, restricted uses, application costs and what has actually been awarded or received. SDG 11 is a reporting reference, not an IMOBX grant award. No named fund's amount or application date is assumed in this specification. One thousand homes remains a cohort-model hypothesis, not a self-sufficiency milestone already proved.

8. What changes from the original devsheet

Original PDF topic	Revision for the pilot
Guaranteed floor and downside protection	No token price floor; asset values, liabilities, resident commitments and legal claims require separate assessment.
Yield rises when holders sell	Selling ordinarily changes ownership. Any staking-denominator change is conditional and not automatic new income.
98% of rent paid out, then rent funds replacements	Retain a reviewable cash order; show amounts already spent/distributed and capital actually available.
Flat fees and profitable-bear scenarios	Use documented fee mechanics and actual treasury receipts; test volume, size, venue capture and seasonal costs.
$109/year at any holder count	Describe accumulator work and individual claims; measure a comparable deployment before making a cost claim.
Locked liquidity prevents all loss	Document the position and its restrictions; price, control, integration and delivery risks still need handling.
Two founder properties and grant amounts	Count only documented control/received funding; offered resources and prospective awards stay separately labelled.
Institutional RWA figures and competitor failures	Remove unsupported market/return comparisons from public copy. Explain IMOBX's own rights, operations and verified outcomes.

Source and decision status

Read for this revision: text and visual layout of all eight pages of the original IMOBX_Devsheet (3).pdf; current publication drafts and existing cost/platform research. Arctide integration documentation and CVM Guidance Opinion 40 were revisited on 15 October. Original chat cost detail comes from the earlier research; this pass did not reread the full chat or verify title, permits, grants, tax or company documents.

Evidence status: Historical planning figures are founder-supplied. Platform references describe the reviewed design and are not a certification of a current IMOBX deployment. Public sources are linked in the relevant sections.

Use: founder, accountant, housing adviser, legal/provider and developer consultation. Settle the actual rights and pilot scope, then update this sheet, whitepaper, deck and website from the same accepted decisions. Use specific mechanisms, evidence and ordinary language. This remains a development proposal; the document does not establish a token sale or an approved housing or payment service.
